25th June 2019

Dear Ms Hindley

Re:- Ms Marilyn Johnson

I am writing regarding Ms Johnson who was diagnosed with ruptured tubal ectopic pregnancy. She is being discharged today and requires further care and assistance.

Initially, Ms Johnson presented with hypogastric pain and vaginal bleeding. On examination, she looked pale, weak and her peritonium was guarded. Her blood pressure decreased which is 90/60 mm of Hg as per the normal range. She is 8 weeks pregnant with ~~eight weeks~~ but she has not performed ultrasound yet.

On 20th June 2019, Ms Johnson performed ~~various~~ tests such as ~~she has performed~~ ultrasound which revealed empty uterine cavity. She has also done laparoscopy which showed haemoperitonium along with leakage due to left tubal pregnancy in the ampullary region. Regarding her nursing management, wound clearing and dressing was done. Currently, she is stabilized and her condition is good.

Please record your answer on this page.

(Only answers on Page 1 and Page 2 will be marked.)

As per the discharge plan, it would be appreciated if you could provide counselling to Ms Johnson as she is very anxious to start ~~new~~ ^{another} pregnancy. Please advise her to avoid sexual intercourse for couple of months ~~inspite~~ ^{in spite} ~~use~~ ^{of} barrier contraception ~~along with~~ ^{if taking intercourse} wait for three months or two menstrual cycles before getting pregnant. I kindly request you to advise her about possibilities of high risk in future pregnancies. So, perform early ultrasound scans and monitor human chorionic gonadotropin levels. Please provide her folic acid supplements.
